

## How to Prepare to Paint Your Walls?

---

Painting the walls of your home is very important because it's like dressing up your house both for beauty and protection. When it comes to the interiors, painting your home provides better aesthetic value to your house, increases the lifespan of the walls, improves the functionality of your house, repairs damaged and cracked holes protects against the invasion of bugs & pests, and raises its property value. So whether you like to paint your walls yourself or hire a professional service to do it for you just keep in mind that painting gives a fresh perspective and a whole new aura to your home.

If you want to paint your walls on your own, there are certain steps that you need to follow to make your project a success and do it just like the experts.

1. **Planning your move** – You need to envision what exactly you want your result to be like. You can try to experiment with colors on your wall and don't have to worry about the uniformity of the color. All the four walls don't just have to be of one color. Once you have a clear picture of what you want it to exactly look like you can get yourself a great design to work on and get appropriate results.
2. **Choosing the right color** – People usually get most confused when it comes to choosing the right color or color combination for their personal spaces May it be your office or your house the color that you choose reflects your personality on the walls. So first you need to decide what kind of shade you want, a warm, cool, neutral, or saturated shade? The color should

complement your furniture for the room to look great. So, if you have some previously owned furniture check to see if the color shade chosen by you matches them.

3. **Selecting the exact tools for the job** – Painting is a personalized project and every project requires different equipment to get the work completed. You have to establish the condition of your walls, the type of paint to be used, and the best climate for the chosen paint. If your building or wall is prone to molds and grim, you may have to put in some extra protection along with the paint.
4. **Deciding on how much paint to use** – Generally speaking, professional painters go for the one gallon per 400 square feet rule. But that can vary as per your requirements. If you are going for a dark shade, more paint will be used for coating. If you already have a dark shade and want a light one you might have to mix up colors which can also increase the quality required. If the whole process is getting confusing for you, you can always take the help of [professional wall painting services in Bhubaneswar](#) to do it for you.
5. **Arranging the room and the walls** – Painting is a messy process and it can just splash everywhere. So, before starting your painting job, you need to move your favorite furniture either out of the room or away from the walls towards the center.

You can try these points if you want to paint your walls on your own.
